ABSTRACT

Plagiarism is the act of copying another person's work or ideas without giving proper credit. It is a common problem in schools, colleges, and publishing, where students and writers submit assignments, reports, essays, and other documents. Manually checking these documents for copied content is time-consuming and may not always be accurate. This project presents a **Word-Level Plagiarism Checker for Short Documents**, which compares a submitted document with a collection of reference documents to identify copied or similar content. The system checks words one by one, finds matching words and phrases, calculates the similarity percentage, and identifies the source document containing the matched content. It uses basic Data Structures and Algorithms such as arrays, strings, hashing, and searching to perform document comparison efficiently. The proposed system is simple, fast, and user-friendly. It helps teachers, editors, and publishers verify the originality of documents while reducing the time and effort required for manual plagiarism checking.
